

FlyportPRO Wi-Fi 802.11G

System on module

Introduction

FLYPORTPRO Wi-Fi is a miniature **web server module** featuring a fully integrated 802.11g Wi-Fi interface and several interfaces to the 'real world'.

The module integrates a powerful **16 bit processor** which runs custom applications and a **Wi-Fi certified transceiver** which handles the connectivity. 2 versions are available: one with PCB antenna and the other with uFL connector for an external antenna.

The module provides the embedded world with a powerful 'Internet engine' to a browser-based interface over Internet, in a small footprint, at low power and low cost. Real time data can be both displayed and/or updated from a standard web browser, even on smartphone or tablets, because FLYPORTPRO supports dynamic web pages.

The module form factor is identical to FlyportPRO Ethernet and FlyportPRO GPRS and compatible pinout.

FLYPORT is powered by openPicus framework based on FreeRTOS. The free IDE allows to create applications, to import web pages and to compile and download code to the module.

Features

16 Bit Processor	PIC24FJ256GB206 - 256K Flash – 96K Ram – 16 Mips
Transceiver	MRF24WG0MA/MB 802.11g Wi-Fi certified
Antenna	PCB antenna or uFL connector for external antenna
Power Supply	3,3V
Low power	Hibernation 20mA and Sleep 180uA
USB	On the Go (OTG)
Integrated RTC	32,768 Khz quartz onboard
Digital I/O	up to ..., remappable at Runtime
Analog In	10 channels - 10bits ADC - Voltage ref onboard 2,048V
Communication	up to 4 UARTs, SPI, I2C
Flash	16 Mbit
Eeprom	64 Kbit
Connectors	2*30 ways, pitch 1.27mm female pin header
Dimensions	34 x 34 x 9 mm, 10 grams

- 802.11g WIFI
 - Infrastructure mode
 - softAP mode
 - Ad hoc mode
- Microchip PIC 24FJ256GB206 16 bit processor
- WiFi Transceiver
 - Microchip MRF24WG0MA/MB PCB Antenna or uFL connector
- Connectivity Services
 - Web server (customizable)
 - TCP
 - FTP
 - UDP
 - SNTP
 - SMTP
 - FOTA: Firmware upgrade over Internet
- 16Mbit Flash Memory for web server and FOTA
- EEPROM
- USB OTG
- RTCC
- Remappable pins at runtime
- Digital I/Os, PWM
- 10 Analog Inputs (10 bits ADC and precise voltage reference)
- 4 UARTs, 1 SPI, 2 I2C
- Serial bootloader onboard

Applications

- Webserver based user interfaces to the embedded
- Sensors and automation
- Internet of Things
- Audio over IP
- Building automation and remote control
- Industrial/process management

Introduction

FLYPORTPRO Wi-Fi is powered by openPicus framework and mounts a 256K Flash 16bit processor from Microchip that runs the Wireless Stack and the application layer. This means that you have full control of the connectivity (extremely important for energy saving) and the application (for ex. the PIC microcontroller onboard can process data coming from an analog sensor and display these data on the integrated webserver, or send by email or save to a remote FTP server). FLYPORT has an extra 16Mbit Flash memory onboard to store web server pages and for Firmware upgrade over Internet.

FLYPORT Wi-Fi works in 3 ways:

- Infrastructure mode Flyport connects to a Wi-Fi network (to access points or routers)
- softAP Flyport itself acts like an access point. It's limited to 1 client only
- Ad Hoc Point to point. *Deprecated since not compatible with Android devices!*

Available onboard:

SPI, I2C, UART and embedded Real Time clock.

I/O : analog and digital and PWM.

Remappable pinout:

Special functions such as SPI, UART, PWM and Interrupts can be assigned to any remappable pin at runtime.

Programming:

We provide the free IDEpro with each StarterKit.

C programming skills are needed. No expensive programmer is needed since the serial bootloader loaded on the module allows you to flash the firmware using just a serial cable.

On www.openpicus.com you can find examples, libraries and tools to start to develop immediately.

Electrical characteristics

VOLTAGE RATINGS

+3.3V DC Voltage input (pin 4) **MIN:+3,0V MAX:+3,3V**

CURRENT CONSUMPTION

Power supply 3.3V, Ambient temperature 25°C

Wi-Fi not connected	35 mA	Micro ON and Wi-Fi on but not connected
Wi-Fi connected	150 mA	Micro ON and Wi-Fi infrastructure mode connected to an access point
Hibernate mode	20 mA	Micro ON and Wi-Fi transceiver OFF
Sleep mode	180 uA	Micro OFF and Wi-Fi transceiver OFF

Wi-Fi 802.11g (Microchip transceiver MRF24WG0MA/MB)

Certifications **FCC (USA), IC (Canada), ETSI (Europe)**

For detailed info about the transceiver and related documentation (FCC ID and more) please visit <http://ww1.microchip.com/downloads/en/DeviceDoc/70686B.pdf>

Security **WEP, WPA-PSK, WPA2-PSK Security**

Frequency range **2412-2484 Mhz**

Output power **16 dBm**

Sensitivity **RX min input level, 1Mbit, 8%PER: -95 dBm**
RX min input level, 2Mbit, 8%PER: -88 dBm

Encryption **AES128**
RSSI **Yes**

Mechanical info

Dimensions **34*34*9 mm**
Weight **10 grams**

Temperature range

Operating range **MIN: -20°C MAX: +85°C**

Module overview

TOP VIEW

NO FLY ZONE!

BOTTOM VIEW

DON'T PLACE COMPONENTS, TRACKS OR COPPER UNDER THE NO FLY ZONE since the Wi-Fi performance may be affected!

Footprint and dimensions

On your carrier board we suggest to use 2*15 ways pitch 1.27mm Male pin header connectors such as:

TH: SAMTEC FTSH-115-04-F-D
SMT: SAMTEC FTSH-115-04-F-DV

NOTE: The following view is made in transparency from TOP. On the right corner there's a triangle sign on the silkscreen to identify where is J1.
